In this case, understanding the speciation and transport properties of actinides in brines is critical for confidence in repository performance and risk assessment activities. Many deep groundwaters underlying existing contaminated sites are also high in ionic strength.

Actinide Speciation in High Ionic Strength Media

As is the case with other environmental contaminants, the solubility, transport properties, bioavailability, and toxicity of actinides are dependent on their speciation (composition, oxidation state, molecular-level structure, and nature of the phase in which the contaminant element or molecule occurs).

Thus, high-energy scattering is an optimal technique for studying actinide-containing solutions. X-ray scattering has often been used to quantitatively probe electron densities in crystalline materials [19 , 20]; however, it has only recently been extended to probing coordination and bonding in solutions [21 , 22 , 23].
