Wireless sensor network (WSN) refers to a group of spatially dispersed and dedicated sensors for monitoring and recording the physical conditions of the environment and organizing the collected data at a central location. WSNs measure environmental conditions like temperature, sound, pollution levels, humidity, wind, and so on. These are similar to wireless ad hoc networks in the sense that ...

In the broadest definition, a sensor is a device, module, or subsystem whose purpose is to detect events or changes in its environment and send the information to other electronics, frequently a computer processor. A sensor is always used with other electronics. Sensors are used in everyday objects such as touch-sensitive elevator buttons (tactile sensor) and lamps which dim or brighten by ...

Every twelve to eighteen months, computers double their capabilities, and so do the information technologies that use them. Governments and the largest companies in the world use Ray Kurzweil's historical trends of exponential growth charts for predicting the future.. The chart to the left shows the improvement level that our technology will have during the next five years.
