passengers may be having their very first experience to piston-powered aircraft; and they tend to be suspicious of small planes anyway. Unlike the higher-frequency vibrations produced by cylinder firing, vibrations as a result of engine or propeller unbalance tend to be in the 15-45 Hz range and may be felt throughout the airframe.

The engine was run on teststands during 1945, and an engine cowling was developed to maximize the efficiency of the pressurized air-cooling. While the engine ran well, the end of piston-powered military aircraft and civil airliners was on the horizon, with piston engines being supplanted by jet engines.
