In radio, an antenna is the interface between radio waves propagating through space and electric currents moving in metal conductors, used with a transmitter or receiver. In transmission, a radio transmitter supplies an electric current to the antenna's terminals, and the antenna radiates the energy from the current as electromagnetic waves (radio waves).

Page 8 " Quickstart Guide for All Hams Table 1 CTCSS Tone Frequencies The purpose of CTCSS (PL) is to reduce co-channel interference. CTCSS-equipped repeaters respond only to signals that include the CTCSS tone required for that repeater.

Understanding Practical Antennas and Design

A directional antenna or beam antenna is an antenna which radiates or receives greater power in specific directions allowing increased performance and reduced interference from unwanted sources. Directional antennas provide increased performance over dipole antennas " or omnidirectional antennas in general " when greater concentration of radiation in a certain direction is desired.

Slotted Waveguide Antennas. Unlike wideband antennas like the biquad, slotted waveguides are resonant antennas, and have a relatively narrow operating frequency range. The designs I am describing on this page have an adequate bandwidth for any WLAN, but they have been carefully designed and must be equally carefully constructed.
