Current Landscape of Antiviral Drug Discovery - F1000Research

Combating viral diseases with vaccines or antiviral drugs, or both, is a constant challenge. Even when successful strategies are discovered and employed, the high rate of genetic change exhibited by many viruses, particularly RNA viruses, often enables drug resistance or vaccine escape.

Antiviral drug discovery by targeting the envelope glycoproteins of influenza A virus Repon Kumer Saha 1 *, Takashi Suzuki 2 , Yasuo Suzuki 3 Influenza A viruses are enveloped RNA viruses and composed of eight single-stranded, negative-sensed RNA

Antiviral drug discovery by targeting the envelope

Here we critically review the state-of-the-art in broad-spectrum antiviral drug discovery. We discuss putative targets and treatment strategies, with particular focus on natural products as promising starting points for antiviral lead development.

Antiviral drug discovery: broad-spectrum drugs from nature

As they bear potential in drug-design, the discovery of small organic compounds inhibiting filovirus entry is a currently very active field. Although it is at an early stage, the development of antiviral drugs against Ebola and Marburg virus entry might prove essential to reduce outbreak-associated fatality rates through post-exposure treatment of both suspected and confirmed cases.

Filovirus proteins for antiviral drug discovery: A

Continued discovery and development of new antiviral medications are paramount for global human health, particularly as new pathogens emerge and old ones evolve to evade current therapeutic agents.

antiviral treatments. For anti-viral therapy, it is concei-vable to target viral proteins that interfere with the induction of ISGs thus releasing the innate immune response to combat viral infection. An anti-host strategy used by viruses that complicates transcriptome analysis involves interference with cellular RNA metabolism.
