problem of selecting among probability models to fit data: (1) use of statistical criteria such as Akaike's information criterion and Schwarz's "Bayesian information criterion," (2) maximization of the posterior probability of the model, and (3) maximization of an "effectiveness ratio" trading off accuracy and computational cost.

the probabilistic model just presented; it has a number of advantages over relative likelihood, notably, it does not validate any of the invalid patterns presented in Yalcin (2010) while validating the good patterns, and this is because it acts according to the theorems of the theory

model, and it can be viewed as a penalty for the model size. 3 A MAP APPROACH A full-fledged Bayesian approach to the problem of model selection is not to select any single model, but to specify a prior distribution over a mutually exclusive and collectively exhaustive set of models, and to update this with the data.

Three Approaches to Probability Model Selection

Probabilistic Relational Models (Getoor, 2000) define a language that can be used to describe the relationships - structural and probabilistic - between classes and variables, and thus allows representing dependencies between sets of objects.

An Approach to Inference in Probabilistic Relational

ing this idea, our approach is also based on a probabilistic model, and, as in [20], we explicitly model the processes leading to exceptional assignments and wrong assignments.

approach makes a variety of novel predictions which have been experimentally confirmed. The book considers the implications of this work, and the wider "probabilistic turn" in cognitive science and artificial intelligence, for understanding human rationality.

Principles of Bayesian Rationality: The Probabilistic Approach

In this chapter, we more systematically introduce this probabilistic approach to IR, which provides a different formal basis for a retrieval model and results in different techniques for setting term weights.
