In the present article we illustrate a Bayesian method of evaluating informative hypotheses for regression models. Our main aim is to make this method accessible to psychological researchers without a mathematical or Bayesian background.

### **Illustrating Bayesian evaluation of informative hypotheses**

The software package Bain can be used for the evaluation of informative hypotheses with respect to the parameters of a wide range of statistical models. For pairs of hypotheses the support in the data is quantified using the approximate adjusted fractional Bayes factor (BF).

### **Bayesian evaluation of informative hypotheses for multiple**

Null hypothesis significance testing (NHST) is one of the main research tools in social and behavioral research. It requires the specification of a null hypothesis, an alternative hypothesis, and data in order to test the null hypothesis. The main result of a NHST is a p-value [3]. Unable to display ...

For more technical details about Bayesian evaluation of informative hypotheses see Mulder et al. (2010), Mulder et al. (2009), or Hoijtink et al. (2008). In Bayesian hypothesis evaluation one may compute a Bayes factor that expresses the relative support for one hypothesis versus another hypothesis given the data.

### **Illustrating Bayesian Evaluation of Informative Hypotheses**

A Bayesian approach is used for the evaluation of informative hypotheses and is introduced at a

non-technical level in the context of analysis of variance models. Technical aspects of Bayesian evaluation of informative hypotheses are also considered and different approaches are presented by an international group of Bayesian statisticians.
