significant constraint to ecosystem response to CO<sub>2</sub> enrichment ultimately depends upon the allocation of C to coarse or fine roots, i.e., storage vs. resource capture functions. Allocation to coarse roots should have little short-term effect on belowground function, and would tend to buffer responses of ecosystems rising CO<sub>2</sub>.

in assessing belowground responses because of the wide range of scales over which belowground processes operate. Third, more information is needed on the potential feedback mechanisms that could mediate whole-ecosystem responses to environmental change. ... BELOWGROUND RESPONSES TO CLIMATE CHANGE Long-term enhancement of N availability and plant ... While rising atmospheric CO<sub>2</sub> ... ever, it remains uncertain if ecosystem responses to elevated CO<sub>2</sub> can

be sustained (Dufresne et al. 2002; Reich et al. 2006a).
