

beyond loop level parallelism pdf

Parallel computing is a type of computation in which many calculations or the execution of processes are carried out simultaneously. Large problems can often be divided into smaller ones, which can then be solved at the same time. There are several different forms of parallel computing: bit-level, instruction-level, data, and task parallelism. ...

Tensor Comprehensions: Framework-Agnostic High-Performance

Stream processing is a computer programming paradigm, equivalent to dataflow programming, event stream processing, and reactive programming, that allows some applications to more easily exploit a limited form of parallel processing. Such applications can use multiple computational units, such as the floating point unit on a graphics processing unit or field-programmable gate arrays (FPGAs ...

The Future: During the past 20+ years, the trends indicated by ever faster networks, distributed systems, and multi-processor computer architectures (even at the desktop level) clearly show that parallelism is the future of computing.. In this same time period, there has been a greater than 500,000x increase in supercomputer performance, with no end currently in sight.

After the release of CUDA™ by NVidia many software systems upgraded their infrastructure by using this revolutionary GPGPU framework. The biggest problem during this progress was the monopoly danger of NVidia for GPGPU.

GPGPU : OpenCL vs Cuda vs ArBB

Driven by the insatiable market demand for realtime, high-definition 3D graphics, the programmable Graphic Processor Unit or GPU has evolved into a highly parallel, multithreaded, manycore processor with tremendous computational horsepower and very high memory bandwidth, as illustrated by Figure 1 and Figure 2.
