Big data is a term used to refer to data sets that are too large or complex for traditional data-processing application software to adequately deal with. Data with many cases (rows) offer greater statistical power, while data with higher complexity (more attributes or columns) may lead to a higher false discovery rate. Big data challenges include capturing data, data storage, data analysis ...

Big O notation is useful when analyzing algorithms for efficiency. For example, the time (or the number of steps) it takes to complete a problem of size  $n$  might be found to be  $T(n) = 4n^2 + 2n + 2$ . As  $n$  grows large, the  $n^2$  term will come to dominate, so that all other terms can be neglected—for instance when  $n = 500$ , the term  $4n^2$  is 1000 times as large as the  $2n$  term.
