Carbohydrate metabolism is one area of research that has significantly benefited from in vivo ¹³C MRS since signals from sugar carbons occur in a region of the spectrum that is relatively unpopulated by other resonances. Using specific carbon labelling on different substrates, various metabolic pathways have been studied.

organisms (primarily plants) to manufacture carbohydrate from fatty acids, is considered. Photosynthesis, a process in which light energy is captured to drive carbohydrate synthesis, is described in Chapter 13. Any discussion of carbohydrate metabolism focuses on the synthesis and usage of glucose, a major fuel for most organisms.

Carbohydrates are the major source of energy for the living cells. The monosaccharide glucose is the central

molecule in carbohydrate metabolism since all the major pathways of carbohydrate metabolism are connected with it (Fig. 67.3).

Metabolism of Carbohydrates: 10 Cycles (With Diagram)

Starch is the most widespread and abundant storage carbohydrate in plants. We depend upon starch for our nutrition, exploit its unique properties in industry, and use it as a feedstock for bioethanol production.
