Section 6 is on bifurcation buckling and collapse of ring-stiffened shells with emphasis given to cylindrical shells. Section 7 contains several illustrations of buckling of prismatic shells and panels, that is, structures that have a cross section that is constant in one of the coordinate directions.

These assembled structures, loaded in compression, can buckle overall, that is sheet and stiffeners can collapse together in a general instability mode; the sheet can buckle locally between stiffeners; the stiffeners can cripple; and a variety of complex buckling interactions can occur involving local and overall deformations of both sheet and stiffeners.

utilizes the SW Simulation buckling feature to determine the lowest buckling load. To do that: 1. Right click on the Part name "Study" to open the Study panel. 2. Assign a new Study name, select Buckling as the Type of analysis, and use the thin shell as the Model type, click OK. 3.

With today's computer programs that allow for the analysis of complex structures in which they incorporate advanced analytical techniques such as step-by-step large deformation analysis, buckling analysis, progressive collapse analysis, etc., it is just a natural progression that many structures are now analyzed with these tools.
