Increasing dead time with any process will always eventually drive you unstable. But decreasing dead time to make you unstable is weirdly counter-intuitive. If the dead time were to go down with a PI controller, the loop would remain stable. Let's try this in our test process to see. Here are the responses when we reduce the process dead time to 2 hours.

Control of Dead-time Processes will also be of interest to control researchers and process control engineers. Chapters 1-8 of the text can be used as part of the final-year course for undergraduates in control or process engineering.

Lambda equal to the maximum dead time (Lambda factor equal to the maximum dead time to time constant ratio) is effective for load disturbances at the process input if there are no extenuating circumstances.

Control of a First-Order Process + Dead Time K. Craig 11 "The time delay increases the phase shift proportional to frequency, with the proportionality constant being equal to the time delay. "The amplitude characteristic of the Bode plot is unaffected by a time delay. "Time delay always decreases the phase margin of a system.

Dead times are found in many processes in industry. Dead times are mainly caused by the time required to transport mass, energy or information, but they can also be caused by processing time or by the accumulation of time lags in a number of simple dynamic systems connected in series.

The control algorithm for a dead time process is actually very simple. A PI controller does a fine job. You can also use a fancy model predictive, or model based, or pole-cancellation, or Internal Model Control, or Dynamic Matrix controller or Dahlin or Direct Synthesis Controller.
