powerful decidable second-order theory, would yield a similar unified approach to other classes of solvable  
decision problems, e.g., in the theory of various fields. Let us briefly explain the connection with automata  
theory.

A model is decidable if it has a decidable satisfaction predicate. To be more precise, let  $T$  be a decidable  
theory, let  $\{ \hat{I}_n \mid n \in \mathbb{N} \}$  be an effective enumeration of all formulas in  $L(T)$ , and let  $\mathcal{M}$  be a countable model  
of  $T$ .

### **A complete, decidable theory with two decidable models1**

decidable theory with a prime model has a decidable prime model. Millar and Morley have characterized  
decidable theories with decidable saturated models, and Goncharov and Peretyatkin have  
characterized decidable homogeneous models. Barwise, Schlipf and Ressayre have introduced the notion of  
a computably saturated model.

### **Handbook of Recursive Mathematics, vol. 1 Chapter 1: Pure**

This chapter presents the method of elimination of quantifiers, model theoretic methods, the method of  
interpretations (semantic interpretations, decidable second-order theories, tree theorem, Presburger's  
arithmetic revisited, etc.), and complexity of decision procedures that includes Turing-machine computations,  
the theory WSIS, theories of addition and real-closed fields, and propositional calculus.

$z_1, \dots, z_n$ , for some integer  $n > 0$ . We assume  $L$  has at least  $n$  constants  $b_i, 1 \leq i \leq n$ . The purpose of the variables  $z_i$  is to serve as place-holders to be instantiated with constants  $b_i$  that occur as named object arguments of ground action terms. This language  $L$  consists of two related sets of formulas:  $F_x$  and  $F_y$ .
