The Journal of Mathematical Analysis and Applications presents papers that treat mathematical analysis and its numerous applications. The journal emphasizes articles devoted to the mathematical treatment of questions arising in physics, chemistry, biology, and engineering, particularly those that stress analytical aspects and novel problems and their solutions.

What is NCO? The netCDF Operators (NCO) comprise about a dozen standalone, command-line programs that take netCDF, HDF, and/or DAP files as input, then operate (e.g., derive new fields, compute statistics, print, hyperslab, manipulate metadata, regrid) and output the results to screen or files in text, binary, or netCDF formats. NCO aids analysis of gridded and unstructured scientific data.

The Erlang distribution is a two-parameter family of continuous probability distributions with support  $\hat{\alpha}^{\wedge} [$ ,  $\hat{\alpha}^{\wedge} \hat{\alpha}^{\wedge} ]$ . The two parameters are: a positive integer  $\hat{\alpha}^{\wedge}$ , the "shape", and; a positive real number  $\hat{\alpha}^{\wedge}$ , the "rate". The "scale",  $\hat{\alpha}^{\wedge}$ , the reciprocal of the rate, is sometimes used instead. The Erlang distribution with shape parameter  $\hat{\alpha}^{\wedge} = 1$  simplifies to the exponential distribution.

In mathematics (and, in particular, functional analysis) convolution is a mathematical operation on two functions (f and g) to produce a third function that expresses how the shape of one is modified by the other. The term convolution refers to both the result function and to the process of computing it. Convolution is similar to cross-correlation. For discrete, real-valued functions, they ...
