In nonlinear non-stationary systems, dynamic bifurcations result in a transition to a qualitatively new state. In this paper we examine how the dynamics of transition of such systems may be assessed using the concept of transient basins of attraction.

Dynamic bifurcations in non-stationary systems

Period-doubling bifurcations of a fairly general unimodal map $y_{n+1} = F(y_n, x_n)$ are considered with linearly varying parameter $x_{n+1} = x_n \pm \mu$ ($|\mu| \ll 1$). The sweeping delays the apparent bifurcations. There are structurally different types of trajectories sweeping forwards ($+\mu$) and sweeping backwards ($-\mu$).

Dynamic period-doubling bifurcations of a unimodal map

Abstract: Bifurcations are studied for a power system dynamic model which has previously been used to illustrate voltage collapse. It is found that for this model, the nominal operating point undergoes dynamic bifurcations prior to the static bifurcation to which voltage collapse has been attributed.

DIMENSIONAL ANALYSIS PRACTICE WORKSHEET WITH ANSWERS PDF

Experimental averages for the current and voltage across a nonlinear RLC circuit driven by an external oscillator were obtained and used to characterize the bifurcations to chaos by type III intermittency. Results are compared to measurements of time duration of laminar phase events through the same bifurcation. Critical exponents for both the average of the variables and the average length ...

It is shown, that except for known properties of dynamic bifurcations (the violation of probability symmetry, the presence of a thin structure of the basins of attraction) the phenomenon of inversion of basins of attraction at transition of coefficient of connection through a critical value is also observed at the system. The essential dependence of phenomena on the coefficient of connection in a system is detected.
