The effect of inclination and stand-off on the dynamic

Granular soils are intrinsically complex and a realistic modeling of their dynamic response requires a multiscale, multiphysics computational framework. Indeed, these soils exhibit highly nonlinear behavior marked by multiple spatial and temporal response scales, and involve different constituents whose behavior is governed by dissimilar physics.

A micro-mechanical investigation of the dynamic response

Experimental studies are described in which two different types of air shock are used to induce stress waves in an elastically confined, cylindrical specimen of sand, the objective being to permit direct observation of the effects of unloading on the dynamic response of granular material.

Its main focus is on the dynamics response under large and catastrophic deformations, covering the fundamentals and dynamical processes of porous and granular materials as well as their related sub-scale and micro-mechanical effects. Special emphasis is placed on the modeling and theory of avalanches, debris and mud flows.
