

functional and logic programming pdf

In computer science, functional programming is a programming paradigm—a style of building the structure and elements of computer programs—that treats computation as the evaluation of mathematical functions and avoids changing-state and mutable data. It is a declarative programming paradigm, which means programming is done with expressions or declarations instead of statements.

In functional programming, a monad is a design pattern that allows structuring programs generically while automating away bookkeeping code needed by the program logic. Monads achieve this by providing their own data type, which represents a specific form of computation, along with one procedure to wrap values of any basic type within the monad (yielding a monadic value) and another to compose ...

I don't think that there's any question about the functional approach to programming "catching on", because it's been in use (as a style of programming) for about 40 years.

Suggestion on learning ATS. ATS is feature-rich (like C++). Prior knowledge of functional programming based on ML and imperative programming based on C can be a big plus for learning ATS.

The present code is an implementation of MonadPlus and the MonadPlus transformer with fair conjunctions and disjunctions and with distinct good termination properties. This implementation terminates whereas more conventional MonadPlus realizations (e.g., the List monad) diverge. Here's an example ...
