Gallium arsenide is a III-V compound direct-gap semiconductor with the Ga and As belonging to the third and fifth column of the periodic table, respectively. In the modern optoelectronics and high-speed electronics, this material is gaining prime importance.

Gallium arsenide - an overview | ScienceDirect Topics

Gallium arsenide (GaAs) as a MEMS substrate is a brittle, difficult-to-process material [7] and the machining of GaAs, by diamond saw or by conventional laser, releases arsenic into the atmosphere. This is in the form of either dust or as arsine gas.

Gallium Arsenide - an overview | ScienceDirect Topics

Gallium arsenide (GaAs) is a compound of the elements gallium and arsenic. It is a III-V direct bandgap semiconductor with a Zinc blende crystal structure. Gallium arsenide is used in the manufacture of devices such as microwave frequency integrated circuits, monolithic microwave integrated circuits, infrared light-emitting diodes, laser diodes, solar cells and optical windows.

Gallium arsenide offers a solution to the bits backlog that is beginning to occur. Typically GaAs mobility is four to six times that of silicon, (4000-5002/V0s a cmt 1017/cm³ doping concentration) and the speed of the device is directly related to the mobility. GaAs integrated circuits have been designed and fabricated at the Lockheed ...
