algebra and graph theory in order to derive maximum understanding of this research. The second chapter represents groups as graphs. The main feature of this chapter is that it contains 93 examples with diagrams and 18 theorems. In chapter three we describe

A graph of groups  $(G; X)$  consists of 1) a connected graph  $X$ ; 2) a function  $G$  which for every vertex  $v \in V(X)$  assigns a group  $G_v$ , and for each edge  $e \in E(X)$  assigns a group  $G_e$  such that  $G_e \dots$  Graphs of groups, Lecture 4, part 2 Author: Olga Kharlampovich Created Date:

Graphs of groups. Trees and amalgamated free products This graph is called a segment Theorem Let  $G = \langle G_1, G_2 \rangle$ . Then there exists a tree  $X$ , on which  $G$  acts without inversion on edges such that the factor graph  $G \backslash X$  is a segment. Moreover this segment can be lifted to a segment in  $X$  with the property that the stabilizers in  $G$  of its vertices and edges ...

graph, or the cococomplete graph, depends on the choice of  $X$ ). Choose  $X$ , and  $H = \langle S_2, S_3 \rangle$ , so as to obtain the Petersen graph  $\hat{I}$ . What substructures correspond to the maximal subgroups of  $G$ ? For  $\langle S_2, S_3 \rangle$  one finds a vertex. For  $S_4$  one finds a 4-coclique. For the third group  $AGL(1,5)$  one finds a partition of the graph into two pentagons.

We use index-one voltage graph imbeddings of Cayley graphs (Cayley maps) for the groups  $Z_n^{2n+1}$ , where  $n$  is a prime power, to depict the finite projective planes  $PG(2, n)$ .

PROBABILITY ON GRAPHS AND GROUPS: THEORY AND APPLICATIONS Natalia Mosina We introduce the notion of the mean-set (expectation) of a graph- or group-valued random element. Using this concept, we prove a novel generalization of the strong law of large numbers on graphs and groups. Some other relevant results about

Recall that a group  $G$  is a set  $S$  and a binary operation with the properties that  $G$  is closed under  $\cdot$ , is associative, there exists an identity  $e$  such that for all  $g \in G$ ;  $ge = eg = g$ , and there exist inverses such that for each  $g \in G$ ; there exists  $g^{-1} \in G$  such that  $gg^{-1} = g^{-1}g = e$ .

combinatorial group theory, as we will begin to see in Section 3 discussing presentations. For example Theorem 2.10 says, that any group is a factor group of an appropriate free group, or that any group is obtainable as a homomorphic image of a free group, respectively. Let  $A$  be an arbitrary set and  $A^1 = a_1 \dots a_n$ . We assume that  $A^1 = 0 \dots$

An automorphism of a graph is a permutation of its vertex set that preserves incidences of vertices and edges. Under composition, the set of automorphisms of a graph forms what algebraists call a group. In this section, graphs are assumed to be simple. 1.The Automorphism Group 2.Graphs with Given Group 3.Groups of Graph Products 4.Transitivity

In geometric group theory, a graph of groups is an object consisting of a collection of groups indexed by the vertices and edges of a graph, together with a family of monomorphisms of the edge groups into the vertex groups.
