

### **human populations diversity and pdf**

Human genetic variation is the genetic differences in and among populations. There may be multiple variants of any given gene in the human population (), a situation called polymorphism. No two humans are genetically identical. Even monozygotic twins (who develop from one zygote) have infrequent genetic differences due to mutations occurring during development and gene copy-number variation.

Human genetic clustering is the degree to which human genetic variation can be partitioned into a small number of groups or clusters. A leading method of analysis uses mathematical cluster analysis of the degree of similarity of genetic data between individuals and groups in order to infer population structures and assign individuals to hypothesized ancestral groups.

A global paradox is emerging in which care workers - who are largely migrant women, often working in informal home settings - make a considerable contribution to public health in many countries but are themselves exposed to health risks, face barriers to accessing care, and enjoy few labour and social protections.
