The ammonium cation is a positively charged polyatomic ion with the chemical formula NH_4^+ . It is formed by the protonation of ammonia (NH_3). Ammonium is also a general name for positively charged or protonated substituted amines and quaternary ammonium cations (NR_4^+), where one or more hydrogen atoms are replaced by organic groups (indicated by R).

Halogen bonding is a type of non-covalent interaction which does not involve the formation nor breaking of actual bonds, but rather is similar to the dipole-dipole interaction known as hydrogen bonding. In halogen bonding, a halogen atom acts as an electrophile, or electron-seeking species, and forms a weak electrostatic interaction with a nucleophile, or electron-rich species.
