PDF | A hypercube parallel computer is a network of processors, each with only local memory, whose activities are coordinated by messages the processors send between themselves.

For the hypercube, an autonomous physically interconnected file system is proposed. The resulting distributed file system consists of an I/O organization and a software interface.

Distributed Computing on Oriented ... they are inter-connected in a hypercube topology. Faults may occur only before the start of the computation (and that despite this the hypercube remains a connected network). However, the processors do not know where these faults are located. As a measure of complexity

Hypercube and Distributed Computers - dl.acm.org

A hypercube multiprocessor is a MIMD distributed memory parallel computer in which 2^d nodes are connected in a d -dimensional hypercube topology. In this topology a d -dimensional cube is constructed out of two $(d-1)$ -dimensional subcubes by connecting corresponding nodes so that each node is connected to d

neighbours.

multicomputer, for distributed memory multicomputers (as is our hypercube of Figure 1.1) it is often more
meaningful to measure the maximum local memory requirement of any node. This is so as, typically, such
multicomputers have equal size local memory on each processor.
