purpose, PET imaging of the dopamine network (dopaminergic system) can help to differentiate early stage Parkinson's disease from other "parkinsonian" disorders (multiple system atrophy, progressive supranuclear palsy or

Brain Imaging Technologies and Their Applications in

imaging dopamine dynamics simultaneously with pharmacological manipulation, electrophysiological or optogenetic stimulation, and calcium imaging of local neuronal activity. dLight1 enabled chronic tracking of learning-induced changes in millisecond dopamine transients in mouse striatum.

behaving mice. We demonstrated the utility of dLight1 by imaging dopamine dynamics simultaneously with pharmacological manipulation, electrophysiological or optogenetic stimulation, and calcium imaging of local neuronal activity. dLight1 enabled chronic tracking of learning-induced changes in millisecond dopamine transients in striatum.

dopamine from these vesicles is released into the synapse and binds to the predominantly postsynaptic dopamine receptors. On the presynaptic side, DaTs move dopamine out of the synaptic cleft and back into the nigrostriatal nerve terminals for either storage or degradation. Imaging the integrity of the nigrostriatal dopaminergic

DOPAMINE TRANSPORTER IMAGING WITH SINGLE-PHOTON EMISSION COMPUTED TOMOGRAPHY .

DaT-SPECT is based on the selective affinity of dopamine transporter ligands for dopamine synthesizing neurons, which allows visualization of deficits in the nigrostriatal dopaminergic pathway.

Dopamine Transporter Imaging With Single-Photon Emission

Protocol Dopamine Transporter Imaging With Single-Photon Emission Computed Tomography Last Review Date: 09/17 Page 2 of 6. showed more patients evaluated with DAT-SPECT had changes in diagnosis and management than controls without imaging; however, there is limited evidence to evaluate whether these changes improve health out-comes.
