CAFs drive immunosuppression and resistance to anti-PD-L1 immunotherapy. Yet it remains unclear whether this CAF-mediated immunosuppressive function is relevant in human tumors and if so, what are the mechanisms involved. Although CAFs are the most prominent stromal components, characterizing their heterogeneity in human cancers is far from complete.

and malignancy comparing no induction, IL2RAs, ATG, and alemtuzumab are needed to better understand the effect of the agents and to identify the optimal regimen for lung transplant recipients. Maintenance immunosuppression Maintenance immunosuppression is lifelong immunosuppressive therapy that is given to prevent both acute and chronic rejection.

### **Immunosuppression in lung transplantation**

The immune system can deal effectively with the majority of viruses and bacteria, less effectively with parasites, and very poorly with cancer. Why is this so? Why are McFarlane Burnet's and Lewis Thomas' predictions that the immune system is involved in ridding the body of cancer cells,

### **Diseases associated with immunosuppression.**

Malignancy is a well-recognized complication of transplantation and can manifest as de novo cancer, as a recurrence of a pre-existing malignancy or from transmission of malignancy from the donor. Recent studies show that tumour incidence increases with time after organ transplantation and is related to the intensity of immunosuppression [ 1,2 ].

### **Immunosuppressive therapy and post-transplant malignancy**

28 Are liver transplant recipients at increased risk to develop cancer? Immunosuppression significantly increases the risk of malignancy and complicates approximately 2% of liver transplantations. The most common malignancy following liver transplantation is squamous cell carcinoma of the skin.

### **Immunosuppression - an overview | ScienceDirect Topics**

Immunodeficiency is associated with higher cancer incidence. However, it is unknown whether there is a link between immunodeficiency and development of multiple primary malignancies. In the present study we analyse this link focusing on kidney-transplanted patients, as they are at higher risk of developing cancer due to the chronic assumption of immunosuppressants.

due to inability to withdraw/cease immunosuppression. In addition to conventional therapy, the mainstay of treatment includes reduction in immunosuppression, especially anti-proliferative agents, and use of antiviral agents in those with primary EBV infections (13,14). Lung cancer Risk of lung cancer in transplant recipients is moderately

### **Chapter 16: Cancer in Solid Organ Transplantation**

These "immunosuppressive" drugs make the immune system less able to detect and destroy cancer cells or fight off infections that cause cancer. Infection with HIV also weakens the immune system and increases the risk of certain cancers.

### **Risk Factors: Immunosuppression - National Cancer Institute**

Immunosuppression is a reduction of the activation or efficacy of the immune system. Some portions of the immune system itself have immunosuppressive effects on other parts of the immune system, and immunosuppression may occur as an adverse reaction to treatment of other conditions.
