or fluid points, called the fluid velocity, and two thermodynamic quantities that characterize the fluid state, the pressure  $p(x, y, z, t)$  and the mass density  $\rho(x, y, z, t)$ , the mass per unit volume of fluid.

A variety of nonlinear effects occur in a plasma. First, there are the wave steepening effects which can occur in any fluid in which the propagation speed depends upon the wave-amplitude. In a dispersive medium this can lead to classes of nonlinear waves which may have stationary solutions like ...

equations can be used to describe the nonlinear evolution of a large class of waves in a fluid plasma. The similarity of the asymptotic behavior of solutions to these generic equations suggests the possibility of a unified treatment of nonlinear phenomena and an apparent underlying "simplicity" in their description.

DMD analysis to encapsulate nonlinear dynamics using a linear (but in finite-dimensional) operator-based framework. Global linear stability analysis and resolvent analysis are presented in Sections VII and VIII, respectively. Table 1 provides a brief summary of the techniques to facilitate comparison of the methods

before engaging in details of each method.
