$\hat{E}_k$  is the spectral decomposition of unit corresponding to the operator  $a \in \mathbb{C}^k$ . It is clear that the right-hand side of (1.1) depends on the state itself, not on representing unit vector  $\hat{E}_k$  (it is defined up to a complex factor  $\hat{E}_k$ ,  $|\hat{E}_k|=1$ ). Also this expression does not depend on the order of observables, since the spectral projectors  $E(k) \hat{E}_k$  commute.

The fifth and final chapter is a brief introduction to the theory of unbounded operators on Hilbert space; in particular, we establish the spectral and polar decomposition theorems.

### Functional Analysis: Spectral Theory

a brief introduction to spectral graph theory 5 A formal description of the Petersen graph runs as follows: the vertices are the 2- element subsets of a 5-element set, and edges represent the relation of being disjoint.

### A BRIEF INTRODUCTION TO SPECTRAL GRAPH THEORY

Introduction Spectral Theory The subject of this work is the spectral theory of linear operators, mostly bounded, on a Hilbert space. As an application of the power of this theory we also give a short introduction to the subject of means (geometric, harmonic, arithmetic, etc.) of positive operators. Spectral theory is an infinite dimensional version of the diagonalization of a normal matrix.

Spectral theory could be presented as an attempt to extend the well-known decomposition results in finite dimensional linear algebra (the diagonalization and triangularization of matrices) to analogous situations in infinite dimension.

### **Spectral theory (Cours de M1, Université Paris Diderot)**

The name spectral theory was introduced by David Hilbert in his original formulation of Hilbert space theory, which was cast in terms of quadratic forms in infinitely many variables. The original spectral theorem was therefore conceived as a version of the theorem on principal axes of an ellipsoid, in an infinite-dimensional setting.

A more general spectral theory is based on the concept of a spectral subspace. The spectral manifold of corresponding to a closed subset is defined as the set of all vectors that have a local resolvent in (that is, an analytic  $\lambda$ -valued function satisfying the condition  $(T - \lambda)^{-1} \in \mathcal{B}(X)$ ); a spectral subspace is the closure of a spectral manifold.

### **Spectral theory - Encyclopedia of Mathematics**

Modern local spectral theory is built on the classical spectral theorem, a fundamental result in single-operator theory and Hilbert spaces. This book provides an in-depth introduction to the natural expansion of this fascinating topic of Banach space operator theory.
