Walker and Shiels's Landslide Ecology is a valuable and pioneering work that aims to construct a new area of bioscience and might more properly be entitled "Landslide Geoecology." The book begins not with biological colonization and the species of disturbed habitats, but with the physical qualities of landslides and landslide habitats.

Landslides contribute to aquatic and terrestrial biodiversity. Debris flows and other mass movement play an important role in supplying sediment and coarse woody debris to maintain pool/riffle habitat in streams. As disturbance agents landslides engender a mosaic of seral stages, soils, and sites (from ponds to dry ridges) to forested landscapes.
