As a bonus, by the end of these lectures the reader will feel comfortable manipulating basic Lie theoretic concepts. To apply the techniques of calculus we need  $\epsilon$  things to derivate and integrate.

Quantization and the classical limit. The central aim of these notes is to give a geometric interpretation of relationships between the fundamental equations of classical and quantum mechanics. Based on the present discussion of the harmonic oscillator, one tenuous connection can be drawn as follows.

advanced differential geometry, which was initiated by Riemann. The theory developed in these notes originates from mathematicians of the 18th and 19th centuries. Principal contributors were Euler (1707-1783), Monge (1746-1818) and Gauss (1777-1855), but the topic has much deeper roots, since it builds on the foundations laid by Euclid (325-265 BC).

### Lecture Notes for Geometry 1 Henrik Schlichtkrull

This is often the content of a second course in algebraic geometry, and in an ideal world, people would learn this material over many years, after having background courses in commutative algebra, algebraic topology, differential geometry, complex analysis, homological algebra, number theory, and French literature.

An evolute of a curve  $q(t)$  is a curve  $q^*(t)$  such that the tangent lines to  $q^*$  are orthogonal to  $q$  at corresponding values of  $t$ . Thus  $q^*(t)$  lies on the normal line to  $q$  that goes through  $q(t)$  and has velocity that is tangent to this normal line.
