A phonograph record (also known as a gramophone record, especially in British English, or record) is an analog sound storage medium in the form of a flat disc with an inscribed, modulated spiral groove. The groove usually starts near the periphery and ends near the center of the disc. At first, the discs were commonly made from shellac; starting in the 1950s polyvinyl chloride became common.

The length of a vector  $x = (x_1, x_2, \dots, x_n)$  in the  $n$ -dimensional real vector space  $\mathbb{R}^n$  is usually given by the Euclidean norm:  $\|x\| = \sqrt{x_1^2 + x_2^2 + \dots + x_n^2}$ . The Euclidean distance between two points  $x$  and  $y$  is the length  $\|x - y\|$  of the straight line between the two points. In many situations, the Euclidean distance is insufficient for capturing the actual distances in a given space.

The other consideration is longevity, and I quote two paragraphs from the excellent book by John Watkinson The Art of Digital Audio where he is discussing the magnetic layer of a Magneto-Optical disc: . Magnetic layers with practical Curie temperatures are made from proprietary alloys of iron, cobalt, platinum, terbium, gadolinium and various other rare earths.
