Dirk Beyer & Feng Cheng: Markovian Demand Inventory Models

considered in the bulk of the classical inventory literature, Markovian demands can model demands that are dependent on randomly changing economic and market conditions. As the lost sales situation is often the case in competitive markets, it is interesting and worthwhile to extend the Markovian demand model to incorporate the lost sales case.

Therefore there is a need to consider the joint pricing and inventory control problem in a fluctuating demand environment, and a Markovian demand modeling approach provides an effective mechanism to address this problem.

Multi-period inventory management, Markovian demand, censored demand, Dynamic Programming ... have been focused on different distributions of the demand. Most inventory models in these studies assume that demands are independent and identically distributed over different time periods (e.g. Besbes 2010). However, in recent

We consider the joint pricing and inventory control problem for a single product over a finite horizon and with periodic review. The demand distribution in each period is determined by an exogenous Markov chain.

This paper is concerned with a generalization of classical inventory models (with fixed ordering costs) that exhibit (s, S) policies. In our model, the distribution of demands in successive periods is dependent on a Markov chain. The model includes the case of cyclic or seasonal demand. The model is further extended to incorporate some other realistic features such as no ordering periods and ...
