In the normal ear, middle ear pressure gain (which is the result of ossicular coupling) is frequency-dependent and less than generally believed. The severity of conductive hearing loss due to middle-ear disease or after tympanoplasty surgery can be predicted by the degree to which ossicular coupling, acoustic coupling, and stapes-cochlear input ...

Middle Ear Mechanics in Hearing Reconstruction As every middle ear surgeon can attest, achieving good hearing results from middle ear reconstruction is difficult and unpredictable, with a myriad of factors impacting the outcomes.

### **Middle Ear Mechanics in Hearing Reconstruction | Ento Key**

The human middle ear is a complex mechanical system, which transmits sound from the external ear canal to the inner ear structures. The ossicular chain is the most important part of that system. The physiological range of the middle ear structural elements displacement amplitudes in the process of sound conduction does not exceed 100 nm.

This book includes representative, peer-reviewed articles of the lectures and papers presented during the symposium, and thereby gives an overview of the ongoing research and current knowledge in the function and mechanics of the normal, diseased and reconstructed middle ear.
