strong mixing properties of one-dimensional Gibbs states, see e.g. [63] and [66]. For some very strong mixing properties of a well known "continued fraction" process, see e.g. [100] and [132].

It is divided in two parts, the first covering the definitions and probabilistic properties of mixing theory. The second part describes mixing properties of classical processes and random fields as well as providing a detailed study of linear and Gaussian fields.

There are two basic types of properties that we can associate with matter. These properties are called Physical properties and Chemical properties: Chemical properties are properties of an element or compound in chemical reactions. For example, the fact that sodium reacts with water is a chemical property.

Mixing is concerned with the analysis of dependence between sigma-fields defined on the same underlying probability space. It provides an important tool of analysis for random fields, Markov processes, central limit theorems as well as being a topic of current research interest in its own right.

Liquid-solid mixing is typically done to suspend coarse free-flowing solids, or to break up lumps of fine agglomerated solids. An example of the former is the mixing of granulated sugar into water; an example of the latter is the mixing of flour or powdered milk into water.
