MODELING ANALOG CIRCUITRY WITH VHDL Abstract by Mark Dean Mueller With the increasing use of mixed signal analog and digital technologies in circuit design, there becomes a growing need for a method to simulate such circuits quickly, eas-ily and accurately. Modeling the components structurally with an analog simulation tool is a common technique.

Modeling in Analog Design introduces the reader to 2 major language criteria: VHDL-A and MHDL. It is going directly to supply in-depth examples of using those languages to version analog units. the ultimate half is dedicated to the vitally important subject of modeling the thermal and electrothermal facets of units.

Modeling in Analog Design highlights some of the most pressing issues in the use of modeling techniques for design of analogue circuits. Using models for circuit design gives designers the power to express directly the behaviour of parts of a circuit in addition to using other pre-defined components.

Modeling in Analog Design introduces the reader to two main language standards: VHDL-A and MHDL. It goes on to provide in-depth examples of the use of these languages to model analog devices. The final part is devoted to the very important topic of modeling the thermal and electrothermal aspects of devices.

In this paper we propose a mathematical model that enables better understanding of the analog response of the PIR sensor, the Fresnel lens, and the associated electronic circuitry. The proposed model relates the sensor's analog output waveform to the width of sensing element, and speed of movement and distance of the subject from the PIR sensor.
