mycotoxins and their metabolites in humans and animals

Mycotoxins are toxic secondary metabolites produced by filamentous fungi, possibly to limit competition with other fungal species, although many theories about their function exist. Ingestion of mycotoxins by animals can result in pathology and often in immunosuppression.

Mycotoxins - an overview | ScienceDirect Topics

Their occurrence in food, beverages and feed is caused by direct contamination of plant materials or their products (Ominski et al., 1994), or by a "carry over" of mycotoxins and their metabolites into animal tissues, milk and eggs after intake of contaminated feed (Zillner and Mayer-Helm, 2006).

Major types and their metabolites. At least 14 different aflatoxins are produced in nature. Aflatoxin B 1 is considered the most toxic and is produced by both *Aspergillus flavus* and *Aspergillus parasiticus*. Aflatoxin M 1 is present in the fermentation broth of *Aspergillus parasiticus*, but it and aflatoxin M 2 are also produced when an infected liver metabolizes aflatoxin B 1 and B 2.
