Characterization of the general odorant-binding protein 2

NMR spectroscopic changes as a function of pH in solutions of the pheromone-binding protein of *Bombyx mori* (BmPBP) show that BmPBP undergoes a conformational transition between pH 4.9 and 6.0. At pH below 4.9 there is a single "acid form" (A), and a homogeneous "basic form" (B) exists at pH above 6.0.

NMR characterization of a pH-dependent equilibrium between

"Insect pheromone Biochemistry and Molecular Biology: the biosynthesis and detection of insect pheromones and plant volatiles." Edited by Gary J. Blomquist and Richard G. Vogt Department of Biochemistry, University of Nevada Department of Biological Sciences, University of South Carolina Elsevier (Publisher).

Functional and Expression Pattern Analysis of Chemosensory

The identification of various isoforms of olfactory binding proteins is of major importance to elucidate their involvement in detection of pheromones and other odors. Here, we report the characterization of the phosphorylation of OBP (odorant binding protein) and Von Ebner's gland protein (VEG ...

Insect Biochemistry and Molecular Biology | Vol 27, Issue

Odorant-binding proteins (OBPs) are abundant in the sensillar lymph of insect antennae and participate in olfactory perireceptor events, such as transport of the hydrophobic odorant through the aqueous medium, presentation of the odor to olfactory receptors, and deactivation of the signal.
