C-31 Pentagon Sum Conjecture - The sum of the measures of the five angles of any pentagon is 540° . C-32 Polygon Sum Conjecture - The sum of the measures of the n interior angles of an n -gon is $(n-2) \times 180$. C-33 Exterior Angle Sum Conjecture - For any polygon, the sum of the measures of a set of exterior angles is 360° .

of the Poincaré conjecture and the geometrization conjecture of Thurston. While the complete work is an accumulated effort of many geometric analysts, the major contributors are unquestionably Hamilton and Perelman. An important problem in differential geometry is to find a canonical metric on a given manifold.

The Beal Conjecture, $A^x + B^y = C^z$, is analyzed as of a proof based on selfsame multiples through addition and the presentation of counterexamples. The Beal Conjecture requests the presentation of counterexamples based upon selfsame multiplication, when in fact such counterexamples do

The Beal Conjecture - Number theory enthusiast Andy Beal postulates that $A^x + B^y = C^z$ is impossible with co-prime bases. A US\$1,000,000 prize is offered for a rigorous proof or disproof of the Beal Conjecture.

three-dimensional Poincaré conjecture as a corollary, though this elliptic case of the conjecture is not covered by the hyperbolic theory of Haken manifolds.

The Collatz conjecture is an elusive problem in mathematics regarding the oneness of natural numbers when run through a specific function based on being odd or even, specifically

The Collatz Conjecture: A Brief Overview

A conjecture is a mathematical statement that has not yet been rigorously proved. Conjectures arise when one notices a pattern that holds true for many cases. However, just because a pattern holds true for many

cases does not mean that the pattern will hold true for all cases.

For all evidence indicates he was correct (see [2]). Although the conjecture may be stated in a variety of ways this paper will focus on the modified Collatz map $T: \mathbb{Z}^+ \rightarrow \mathbb{Z}^+$ defined by $T(n) = \begin{cases} \frac{n}{2} & \text{if } n \text{ is even} \\ 3n+1 & \text{if } n \text{ is odd} \end{cases}$. The conjecture is that for every integer n there exists a k such that $T^k(n) = 1$.
