pects of norm-governed specification from distributed multi-agent systems, opinion formation from social networks, and voting procedures from computational social choice.

Interleaving multi-agent systems and social networks for

Adaptation, for purposes of self-healing, self-protection, self-management, or self-regulation, is currently considered to be one of the most challenging properties of distributed systems that operate in dynamic, unpredictable, and potentially hostile environments.

a problem where multiple sources are present but the nature of the problem differs from adaptation since the distribution of the input points is the same for all these sources, only the labels change due to varying amounts of noise.

: A New Organization Model for Self-Organizing Multi-Agent Systems, Based on Self-Adaptation Features
Emergence is the whole behavior of a distributed system that is arisen from behavior of local parts.

A new organization model for self-organizing multi-agent

This is another demonstration of the use of socially-inspired mechanisms for regulation of decentralised systems and a key step towards the realization of organized adaptation for open multi-agent systems.
