transvenous pacemaker leads, especially if one is severed, also increases the risk of thrombosis. P-" In addition, the pacing lead may produce a foreign-body type of reaction and subsequent inflammation and fibrosis along the course of the lead. CLINICAL FEATURES

Venous Complications After Insertion of a Transvenous

(a) Pacemaker leads in the right atrium (RA) and right ventricle (RV). Some patients have a biventricular device, which would have a similar pacing lead in the coronary sinus. (b) A defibrillator lead in the right ventricle (RV). Notice the thickness of the lead due to the defibrillation coil. (c) A subcutaneous defibrillator.

Practical and ethical considerations in the management of

The lead is a conductor through which the pacemaker stimulus reaches the heart and by way of which spontaneous depolarizations of the cardiac chambers may be detected by the sensing amplifier(s). An overriding sheath of silicone rubber, polyethylene or polyurethane provides insulation.

Pacemakers and Implantable Cardiac Deï•brillators: Software

Although pacemaker lead design has dramatically evolved in recent years, the perfect pacing lead has not yet been developed. The ideal pacing lead would provide low thresholds, be of small diameter for ease of implantation and handling, be insulated with a wear-resistant material, and have an electrode impervious to fracture.

heart wall. The lead delivers the electrical impulses to the heart. It also senses the heart's electrical activity and relays this information back to the pulse generator. Pacemaker leads may be positioned in the atrium (upper chamber) or ventricle (lower chamber) or both, depending on the medical condition.

Pacemaker lead displacements can be defined as any other pacemaker position change, whether the functionality of the pacemaker is affected or not. However, only those displacements that provoke a malfunction in the pacing system are clinically relevant.

A pacemaker uses batteries to send electric signals to your heart to help it pump the right way. The pacemaker is connected to your heart by one or more wires. Tiny electric charges that you can't feel move through the wire to your heart. Pacemakers work only when needed. They go on when your heartbeat is too slow, too fast or irregular.

In vivo analyses of pacemaker lead motion during the cardiac cycle have become important due to incidences of failure of some of the components. For the calculation and evaluation of in vivo stresses in pacemaker leads, the 3D motion of the lead must be determined.
