detection method virtually eliminates the possibility of false-on and significantly reduces the possibility of false-off. Integration of Dual Technology Sensor When deciding to integrate ultrasonic sensors and passive infrared sensors into a single application there are some important things to consider.

When the sensor is idle, both slots detect the same amount of IR, the ambient amount radiated from the room or walls or outdoors. When a warm body like a human or animal passes by, it first intercepts one half of the PIR sensor, which causes a positive differential change between the two halves.

The IRM90-R is a passive infrared (PIR) motion detector in an explosion proof housing designed to provide maximum safety and security in Hazardous locations. The detector monitors infrared radiation in

Known as Pyroelectric or Passive Infrared Sensor (PIR, in both cases), this small electronic device is the curious case for this Insight. Every object that has a temperature above perfect zero emits thermal energy (heat) in form of radiation.

### **How PIR Sensor Works | Working Principle of PIR Sensor or**

Infrared detectors are in general used to detect, image, and measure patterns of the thermal heat radiation which all objects emit. At the beginning, their development was connected with thermal detectors, such as thermopiles

The IR sensor itself is housed in a hermetically sealed metal can to improve noise/temperature/humidity immunity. There is a window made of IR-transmissive material (typically coated silicon since that is very easy to come by) that protects the sensing element. Behind the window are the two balanced sensors.

Infrared technology is found not just in industry, but also in every-day life. Televisions, for example, use an infrared detector to interpret the signals sent from a remote control. Passive Infrared sensors are used for motion detection systems, and LDR sensors are used for outdoor lighting systems.

### **The Working Principle and Key Applications of Infrared Sensors**

The term passive in this instance refers to the fact that PIR devices do not generate or radiate energy for detection purposes. They work entirely by detecting infrared radiation emitted by or reflected from objects.

Passive Infrared Sensor (PIR) The term PIR is the short form of the Passive Infra Red. The term "passive" indicates that the sensor does not actively take part in the process, which means, it does not emit the referred IR signals itself, rather passively detects the infrared radiations coming from the human body in the surrounding area.
