

positron emission tomography of pdf

Positron-emission tomography (PET) is a nuclear medicine functional imaging technique that is used to observe metabolic processes in the body as an aid to the diagnosis of disease. The system detects pairs of gamma rays emitted indirectly by a positron-emitting radionuclide, most commonly fluorine-18, which is introduced into the body on a biologically active molecule called a radioactive tracer.

Positron emission tomography - Wikipedia

Brain positron emission tomography is a form of positron emission tomography (PET) that is used to measure brain metabolism and the distribution of exogenous radiolabeled chemical agents throughout the brain. PET measures emissions from radioactively labeled metabolically active chemicals that have been injected into the bloodstream.

La tomografia a emissione di positroni (o PET, dall'inglese Positron Emission Tomography) è una tecnica diagnostica medica di medicina nucleare utilizzata per la produzione di bioimmagini (immagini del corpo).. A differenza della tomografia computerizzata (TC) e della risonanza magnetica nucleare (RM), che forniscono informazioni di tipo morfologico, la PET dà informazioni di tipo ...
