Preparative Chromatography Techniques: Applications in

The main challenge in the design of a preparative chromatography separation is that the systems are too large for developing and optimizing separation methods directly. This is why preparative method designs are always preceded by method development and optimization steps on an analytical scale, most often using an analytical instrument.

In gas chromatography this is easily achieved by varying the column temperature and/or gas flow. In liquid chromatography, composition of the eluent is easily varied. Thus mobile phase with stronger displacing properties is continuously run through the column. Thus the zones are forced more closely together and they become narrower.
