RANDOM FINITE SETS AND SEQUENTIAL MONTE CARLO METHODS IN

training signal is statistically depended on this random set. Uncertainty in a multi-object system is characterized by modelling multi-target state and measurement as random finite sets, analogous to using random vectors for (vector) state and measurement in single-object systems. A random finite set is, in essence, a finite-set-valued random variable.

A random finite set is a set of random variables (or vectors) whose cardinality is also a random variable. In a tracking algorithm a RFS can be used to model the multi-target state where each element of the set model the state estimate for one targets, while the random variable associated to the set cardinality allows us to model target presence uncertainty.

A random finite set (RFS) is an unordered finite set that is random in the number of its elements as well as in their values [24].

Therefore new concepts for autonomous map representations are given in this book, based on random finite sets (RFSs). It will be shown that the RFS representation eliminates the necessity of fragile data association and map management routines.

A Random Finite Set Model for Data Clustering - ba-ngu.vo

Random Finite Sets are adopted as the fundamental tool to represent a map, and a general framework is proposed for feature management, data association and state estimation. The approaches are tested in a number of experiments on both ground based and marine based facilities.

Random finite sets. A random finite set is a convenient probabilistic model for the representation of multiple stochastic dynamic systems (objects) and sensor measurements. Suppose that at discrete-time k there are n objects with states $x_k, 1, \hat{x}_k, x_k, n k$, taking values in the state space $X \hat{S} \dagger R n x$.
