Small supernumerary marker chromosomes (sSMC) in human are present in 0.043% of newborn children. They can be defined as additional centric chromosome fragments smaller than chromosome 20. sSMC include cases with the i(18p)-, the i(12p)- (i.e. Pallister Killian-) or the inv dup(22)- (i.e. cat-eye ...

Small supernumerary marker chromosomes (sSMC) can have different forms; they can appear as inverted duplication chromosomes (inv dup), minute chromosomes (min) or ring chromosomes (r). We define sSMC as small structurally abnormal

### **Small supernumerary marker chromosomes (sSMC) in humans**

Complex small supernumerary marker chromosomes (sSMC) constitute one of the smallest subgroups of sSMC in general. Complex sSMC consist of chromosomal material derived from more than one chromosome; the best known representative of this group is the derivative chromosome 22 {der(22)t(11;22)} or Emanuel syndrome.
