Interface and colloid science is an interdisciplinary intersection of branches of chemistry, physics, nanoscience and other fields dealing with colloids, heterogeneous systems consisting of a mechanical mixture of particles between 1 nm and 1000 nm dispersed in a continuous medium. A colloidal solution is a heterogeneous mixture in which the particle size of the substance is intermediate ...

In materials science, asperity, defined as "unevenness of surface, roughness, ruggedness" (OED, from the Latin asper "rough"), has implications (for example) in physics and seismology. Smooth surfaces, even those polished to a mirror finish, are not truly smooth on a microscopic scale. They are rough, with sharp, rough or rugged projections, termed "asperities".

Young Awards. ISSS-8 Young Researcher's Awards will be offered in the following two categories on a competitive basis. Anyone 35 years old or younger on October 22, 2017 is encouraged to apply as eligible (the date of birth will be checked by passport or appropriate photo ID at the conference site). An application must be made in the website for abstract submission.

About the Environmental Science Division (EVS) The Environmental Science Division conducts research on environmental systems to understand how system components could change as a result of energy activities, nationally important emerging technologies, and major new federal policies and programs.

### **Environmental Science Division (EVS) of Argonne National**

Surface tension is an effect where the surface of a liquid is strong. The surface can hold up a weight, and the surface of a water droplet holds the droplet together, in a ball shape. Some small things can float on a surface because of surface tension, even though they normally could not float.

The presence of liquid water at the base of the martian polar caps was first hypothesized more than 30 years ago and has been inconclusively debated ever since. Radio echo sounding (RES) is a suitable technique to resolve this dispute, because low-frequency radars have been used extensively and successfully to detect liquid water at the bottom of terrestrial polar ice sheets.
