from the flux is added to a fixed weight of 60:40 tin-lead solder in a depression in a sheet of copper. This sheet is floated on a solder bath to reflow the alloy, and then stored at 40°C and 93% RH (relative humidity) for ten days, after which it is inspected for "signs of corrosion"™ in or around the flux residues.

SMT Process Recommendations Defect Minimization Methods

The oldest, most popular and still most effective soldering flux. This flux is an organic compound consisting primarily of colophony, a complex rosin found in pine trees.

Flux residues and what to do about them

All fluxes leave behind residues after reflow. When properly processed, no-clean or low-solid flux residues do not degrade electrical performance but will affect the adhesion and flow of the underfill. Elevated lead-free processing temperatures change the characteristics of the flux residues after reflow.
