In mathematics, the integral of a non-negative function of a single variable can be regarded, in the simplest case, as the area between the graph of that function and the x-axis. The Lebesgue integral extends the integral to a larger class of functions. It also extends the domains on which these functions can be defined.. Long before the advent of the 20th century, mathematicians already ...

Dada una función de una variable real y un intervalo $[,]$ de la recta real, la integral es igual al área de la región del plano limitada entre la gráfica de $y = f(x)$, el eje x , y las líneas verticales $x = a$ y $x = b$, donde son negativas las áreas por debajo del eje x . « La palabra "integral" también puede hacer referencia a la noción de primitiva: una función F , cuya derivada es la función dada f .

Criterio de Lebesgue para la integrabilidad de Riemann. Sea una función definida y acotada en $[,]$ y sea el conjunto de las discontinuidades de f en $[,]$. Entonces f (con el conjunto de las funciones Riemann integrables) en $[,]$ si, y solo si, tiene medida cero.

On ne connaît pas toujours une formule pour décrire une fonction, par exemple dans le cas d'une courbe expérimentale. Dans d'autres cas, on ne connaît pas de méthode analytique pour exprimer la primitive, ou bien on n'a pas besoin de l'expression analytique et seule la valeur numérique suffit.

das heißt, das Integral von f ist die Differenz der Flächeninhalte des weißen Bereichs in der Mitte und dem umgebenden Rechteck. Diese Differenz ist aber negativ, das heißt, soll die obige Formel für beliebige Funktionen korrekt sein, so muss man Flächen unterhalb der x -Achse negativ zählen. Man spricht deshalb von einem orientierten bzw. ...

For typographical simplicity and for compatibility with traditional notations, brackets may be dropped in equations when it's clear that summation is intended (because the vectorial object itself wouldn't make sense in the context).

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
