Ranking of Alternatives with Ordered Weighted Averaging

GIS, the Weighted Linear Combination (WLC) and the Ordered Weighted Average (OWA) methods are discussed. A generalised framework of GIS-based spatial decision-making procedure is defined and following the procedure proposed, an example of multi-attribute decision analysis (MADA) in GIS is performed using both WLC and OWA.

The weights distribution of OWA operator can synonymously be viewed as probability density function (PDF), because OWA weights satisfy the basic axioms of probability, i.e., $w_j \in [0, 1]$ and $\sum_{j=1}^n w_j = 1$. Due to this resemblance, probability distributions can be used to generate OWA weights.

The order weights are associated with the criterion values on the location-by-location basis. They are assigned to the i -th location's attribute value in decreasing order without considering from which criterion map the value comes. Eq. (1) can be recognized as the conventional weighted linear combination (WLC) with modified criterion weights.

Ordered weighted averaging with fuzzy quantifiers: GIS

The induced ordered weighted average is an averaging aggregation operator that provides a parameterized family of aggregation operators between the minimum and the maximum.

Ordered weighted averaging functions (OWA) belong to the class of averaging aggregation functions. They differ to the weighted arithmetic means in that the weights are associated not with the particular inputs, but with their magnitude. In some applications, all inputs are equivalent, and the importance of an input is determined by its value.

The ordered weighted averaging aggregation operator (OWA) was proposed by Yager in 1988 [19]. Since its introduction, it has been applied to many fields as neural networks

concepts. As a consequence, the approaches based on first order logic and classical probability theory do not provide an appropriate conceptual framework for dealing with the representation of commonsense knowledge, since such knowledge is by its nature both lexically imprecise and noncategorical.

Description : ABSTRACT: An Ordered Weighted Averaging (OWA) operator computes a weighted sum of sorted inputs. OWA operators have been applied to information aggregation for a variety of computational intelligence applications.

In this paper, GIS-based ordered weighted averaging (OWA) is applied to landslide susceptibility mapping (LSM) for the Urmia Lake Basin in northwest Iran. Nine landslide causal factors were used, whereby the respective parameters were extracted from an associated spatial database.

An extended ordered weighted averaging (EOWA) operator of dimension n is a mapping, F , that has an associated weighting vector with the properties and $\sum_{i=1}^n w_i = 1$, such that: where π , being a permutation such that $\pi(i)$, that is, is the i th highest value in the set X .
