Rom Harr[ac]e shows that despite the centrality of our social and cultural identities, the self must ultimately be understood as autonomous, distinct and continuous - as a shifting but unified pattern of multiplicities and singularities. This masterly analysis offers an opportunity to develop a truly scientific account of personhood.

1.1.2 Regular and singular perturbation problems It is useful to make an imprecise distinction between regular perturbation problems and singular perturbation problems. A regular perturbation problem is one for which the perturbed problem for small, nonzero values of ϵ is qualitatively the same as the unperturbed problem for $\epsilon = 0$.

Existence of Singular Self-Similar Solutions of the Three-Dimensional Euler Equations in a Bounded Domain Xinyu He Communicated by Y. Giga Abstract. A self-similar solution of the three-dimensional (3d) incompressible Euler equations is defined by $u(x,t)=U(y)/(t-\hat{t})^{\pm}$, $y = x/(t-\hat{t})^{\pm}$, $\hat{t}^2, \hat{t}^2 > 0$, where $U(y)$ satisfies

In this paper we describe a special class of self-adjoint operators associated with the singular self-adjoint second-order differential expression $\hat{a},$. This class is defined by the requirement that the sesquilinear form $q(u, v)$ obtained from $\hat{a},$ by integration by parts once agrees with the inner product $\hat{a}, u, v \hat{a},$.

Abstract: Self-shrinkers are the special solutions of mean curvature flow in \mathbb{R}^{n+1} that evolve by shrinking homothetically; they serve as singularity models for the flow. The entropy of a hypersurface introduced by Colding-Minicozzi is a Lyapunov functional for the mean curvature flow, and is fundamental to their theory of generic mean curvature flow.
