system. The use of Petri nets, as reported, substantially reduced the development time compared with the traditional approach. Numerous approaches to the synthesis and implementation of Petri net based sequence controllers have been reported in the past few years [35], [41 I, [541, [791, [109]-[111 I.

In this paper we use a subclass of Petri nets to model database transactions. Classical Petri nets [9] with valueless tokens are a powerful tool to model complex control flow problems, but when data plays an essential role we have to use coloured Petri nets [8]. Coloured Petri nets are very powerful for modeling,

functional verification. Petri nets have proven to be a promising technique for solving scheduling problem. This paper aims at presenting a Petri-net based approach to the scheduling of transactions generated by a test-case generator. Firstly, an extended scheduling timed Petri nets (ESTPN) model is given to support transaction scheduling.

the marking of a Petri net. $M(p_i)$ represents the number of tokens in place p_i at marking M . The initial marking is specifically given in the definition of a Petri net. Similarly as in finite automata, it is reasonable to include the initial state in Petri net model definition because any real system begins its activity at an initial state. The
